

# Compass for the sun

The sun compass is a small, very easy and unbelievable practical instrument. He displays on which place, when and how much insolation is to expect.

The sun compass is made of a yellow anodized aluminium slice of 116 mm diameter with a black printed scale.

In the middle is a water balance and under this a small precision compass. This makes it possible to orientate the instrument to north and make sure it is plumb. The whole thing is covered by a plexiglass dome of ca. 25 mm heigth. The sun compass has a weigth of 98 gramms.

You put this instrument on the place you want to measure. Then the dome reflects the insolation (even when it is cloudy) over the scale, where now you can how much insolation there is on this very place.
